-!- TISSUE SPECIFICITY: Inner ear.
-!- DEVELOPMENTAL STAGE: Expressed at low, constant levels in temporal bone from embryonic day 14 to day 1 after birth. Increases by 8 to 16-fold at day 5, 10 and 20.
-!- SIMILARITY: Belongs to the TMC family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -!- FUNCTION: May be required for the normal function of cochlear hair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TISSUE=Brain, Inner ear, and Testis;

J. Biol. Chem. 263:5804-5814(1988).
-!- FUNCTION: VirB proteins are suggested to act at the bacterial surface and there play an important role in directing T-DNA transfer to plant cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                -!- FUNCTION: PRP's act as highly potent inhibitors of crystal growth of calcium phosphates. They provide a protective and reparative environment for dental enamel which is important for the integrity
                                                                                                                                                                                SUBCELLUIAR LOCATION: Secreted.

FIR: Proteolytically cleaved; PRP-2, PRP-1, and PIF-S yield PRP-4, PRP-3 (protein A), and PIF-F, respectively.

POLYMORPHISM: Allele FRH1-4 is also known as PRH1 DA allele; allele PRH2-1 is also known as PR1 or protein C; allele PRH2-3 is also known as PR1'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SALIVARY ACIDIC PROLING-RICH

"Genes for tryptophan biosynthesis in the halophilic archaebacterium Haloferax volcanii: the tryppeg cluster.";
"J. Bacteriol. 174:1694.1697(1992)
-!- CATALYTIC ACTIVITY: Anthranilate + phosphoribosyldiphosphate = N-5. "phosphoribosyl-anthranilate + diphosphate.
-!- PATHMAY: Tryptophan biosynthesis; second step.
-!- SIMILARITY: Belongs to the anthranilate phosphoribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

-! FUNCTION: Regulator of EGFR mediated signal transduction.

-! SUBUNIT: Interacts with a restricted range of SH3 domain proteins.

-! SUBCELLULAR LOCATION: Nuclear (Potential).

-! ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CBLC HUMAN STANDARD; PRT; 4.4 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WANTAA gene cluster.";

Int. J. Mol. Med. 9:221-227(2002).

-!-FUNCTION: Ligand for members of the frizzled family of seven transmembrane receptors. Probable developmental protein. May be signaling molecule which affects the development of discrete regions of tissues. Is likely to signal over only few cell diameters (By similarly).

-!-SUBCELLUIAR LOCATION: Possibly secreted and associates with the extracellular matrix.

-!-TISSUE SPECIFICITY: Expressed in adult brain, lung, skeletal mascle, heart, and 11-day embryo.

-!-SIMIARITY: Belongs to the Wnt family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MGD: MGI: 2446084; Wht.                                              -i-TISSUE SPECIFICITY: Ubiquitous.
-i-DOMAIN: The N-terminus is composed of the phosphotyrosine binding (PTB) domain, a short linker region and the RING-type zinc finger. The PTB domain, which is also called TKB (tyrosine kinase binding) domain, is composed of three different subdomains: a four-helix bundle (4H), a calcium-binding EF hand and a divergent SH2 domain. DOMAIN: The RING-type zinc finger domain mediates binding to an EZ ubiquitin-conjugating enzyme (BP similarity).
-i-PTM: Phosphorylated on tyrosines by EGFR.
-i-MISCELIAMBOUS: This protein has one functional calcium-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).
PHOSPHOTYROSINE (BY SIMILARITY).

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRBs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12pl3.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 4; Page 24; 36pp; English.

ô ö The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's succeptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia Human, PRP-1; proline-rich protein, saliva, dental caries, chromosome 12p13.2, arginine catabolism, ammonia production, pH increase, oral bacterium, caries prevention. thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. This invention describes a novel method for the use and preparation of cell activating compositions which involves preparing a cell activating composition comprising (a) homogeniating pancreatic tissue in buffer at particulates from the homogenate, (c) optionally incubating the resulting factoriates removed, with a protease; and (d) reactionating the homogenate and selecting fractions that exhibit cell activation activity. The methods can be used for improving treatment outcome or reducing risk of treatment of e.g. cardiovascular disease, inflammatory disease, trauma, autoimmune diseases, arthritis, organ rejection, diabetes and diabetic complications, stroke, ischemia, altohemers, who and about the veterinary treatment of a non-human subject. They can be used in the veterinary treatment of a non-human subject. Protease inhibitors can be used to lower cell activation resulting from these diseases and deficiencies. The detection of an elevated level of hydrogen peroxide dismutase (SOD) indicates leukocyte up regulation, as disease onset or ischemic complications. An elevated level of hydrogen peroxide in plasma or whole blood and in the presence of superoxide dismutase (SOD) indicates leukocyte up regulation, as disease onset or ischemic complications. An elevated level of hydrogen peroxide in plasma or whole blood and a low level in the presence of SOD is indicative of a chronic or immune compromised condition e.g. hypertension or sepsis. ANYSOZOI-YSO334 represent peptides used in the method of the invention Use of cell activating compositions in developing products for diagnosis and treatment of e.g. cardiovascular, inflammatory, autoimmune or Alzheimer's disease, trauma, arthritis, organ rejection, diabetes, stroke Example 9; Page 183; 184pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ·:
                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are determinants of a person's susceptibility to dental caries. PRPs are fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-
                                                                                             Human, PRP-1; proline-rich protein, saliva; dental caries;
chromosome 12p13.2; arginine catabolism; ammonia production; pH increase;
oral bacterium; caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, PRP-1; proline-rich protein; saliva; dental caries;

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRBs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are determinants of a person's susceptibility to dental caries. PRPs are fragments. These are metabolised by oral bacteria for mutritional purposes, with certain bacterial species generating ammonia via the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the plf at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, PRP-1, proline-rich protein, saliva, dental caries,
chromosome 12p13.2; arginine catabolism, ammonia production, pH increase,
oral bacterium, caries prevention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                 New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia the catabolism of arginine. The peptides of the invention, being arginine-rich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the teeth against caries. Sequences AAB48771-B48783 represent the PRP-1-derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug
                                                                                        New oligopeptides comprising 2 arginine residues from degradation of
proline-rich proteins, useful for preventing dental caries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, complementary peptide, ligand, drug discovery; drug design.

The invention relates to human PRP-1-derived oligopeptides (AAB48771-AAB48783) which contain at least two arginine residues and which protect against dental caries. PRPs (proline-rich proteins) are salivary proteins encoded by six clustered genes on chromosome 12p13.2 and are potential determinants of a person's susceptibility to dental caries. PRPs are degraded by Actinomyces and Streptococcus species to small peptide fragments. These are metabolised by oral bacteria for nutritional purposes, with certain bacterial species generating ammonia the catabolism of arginine. The peptides of the invention, being arginine-tich, can also be converted to ammonia by these bacteria. The ammonia thus formed raises the pH at the dental surface, thereby protecting the derived oligopeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; PRP-1; proline-rich protein; saliva; dental caries; chromosome 12p13.2; arginine catabolism; ammonia production; pH increase; oral bacterium; caries prevention.
relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification
                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligopeptides comprising 2 arginine residues from degradation of proline-rich proteins, useful for preventing dental caries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

AAU01685 standard, protein, 25 AA (first entry) 18-JUL-2001 AAU01685; RESULT 11 AAU01685

Gene 28 human secreted protein homlogous amino acid sequence.

Human secreted protein, diagnosis, autoimmune disease, rheumatoid arthritis, hyperproliferative disorder; neoplasm; sunburn; cardiovascular disorder; cardiovascular disorder; cerebronascular disorder; cerebral ischaemia; angiogenesis, nervous system disorder; skin aging; Alzhelmer's disease, infection; ocular disorder; corneal infection; wound healing; epithelial cell proliferation; chemotaxis; preservative; organ transplantation; tissue regeneration; food additive.

Homo sapiens.

Nucleic acids encoding 38 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease and diabetic retinopathy.

Disclosure; Page 47; 488pp; English.

AAU01641-AAU01698 represent human secreted protein amino acid, and related amino acid sequences of the invention. The human secreted protein sequences are used to prevent, treat or ameliacal condition in e.g. humans, mice, rabbits, goats, horses, cate, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to human cested proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosobent assays (BLISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. reducimmunoassays or enzyme linked immunosobent assays (BLISA). Disorders with the backovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection, viruses and thust and ocular disorders e.g. corneal infection. The polypeptides can be also be used to aid wound healing and epithelial cell proliferation, to supporting cell culture of primary tisques, to corneal infection and contact in the subpurs of primary tisques, to corneal infection or contact in the contact of primary tisques, to corneal infection or contact in the contact of primary tisques, to corneal infection or contact in the contact of primary tisques, to corneal infection or contact in the contact of primary tisques, to contact the contact in the contact of primary tisques, to contact the contact of primary tisques, to contact the contact of the contact of primary tisques, to contact the contact of the contact of primary and contact of the conta transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities

WPI; 1999-562050/47.

New isolated human genes, useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

Disclosure; Page 118; 484pp; English.

This sequence represents a fragment of a secreted human protein encoded by the mucleic acid molecule detailed in the descriptor line. The gene can be used conscious detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Pc portion (e.g. AAZ24802) for increasing the stability of reflates to 95 novel genes and their fragments (nucleic acid sequences: AAZ4811-Z24907, amino acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypoptides in a sample or by determining the presence of mutations in the new polyhucleotides. Specific uses are described for each of the 95 polymucleotides, based on which tissues they are most highly expressed in (see AAZ24811 for described uses) AAYA1484
AAY AAY00658 standard; protein; 34 AA.

Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breat carcinomas, colon carcinomas, leukaemias, lymphomas, osteosarcomas or smooth muscle cell hyperplanias or skin proliferation and differentiation (expansion of haematopoietic stem cells proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As well, in wound healing, hair growth, treatment of disease cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth following injury
                                                                                                                                                                                                                                                                                                                                                                     neuroblastoma; breast carcinoma; colon carcinoma; lymphoma; osteosarcoma; smooth muscle cell hyperplasia; stem cell proliferation; Wilm's tumour; stem cell differentiation; organ regeneration; organ differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for

This sequence encodes a fragment of a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for diagnosing cancer in a patient. The telomerase can be used for diagnosing cancer in a patient. The telomerase can skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, other skin cancers, neuroblastomas or smooth muscle cell hyperplasias or skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cell proliferation and differentiation (expansion of themse cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, nerve cell or brain cell growth of some of the full length human

(HUMA-) HUMAN GENOME SCI INC

Olsen H; Rosen CA, Shi Y, Moore PA, Ruben SM, Lafleur DW, Ebner R, Brewer LA;

WPI; 2002-599716/64.

New polynuclectides and polypeptides useful for diagnosing, prognosing, treating or preventing e.g. neurodegenerative, central nervous system, autoimmune, respiratory, reproductive, or inflammatory diseases or disorders.

Claim 11; Page 54; 785pp; English.

The invention relates to novel genes (ABQ92553-ABQ92607) and proteins medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune blistockers e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing ; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic RESULT 15

Application US/08454730;
Sequence 1. Application US/08454730;
Patent No. 5789177;
GENERAL INFORMATION:
APPLICANT: Rijeswijk, Franciscus Antonius Maria
APPLICANT: Rijeswijk, Franciscus Antonius Maria
APPLICANT: Maes, Roger Kamiel
TILLE OF INVENTION: Bevine Herpesvirus Type 1
TITLE OF INVENTION: Deletion Mutants, Vaccines Based
TITLE OF INVENTION: Delection Of Bovine Herpesvirus
TITLE OF INVENTION: Thereon, Diagnostic Kits For
TITLE OF INVENTION: Type 1
NUMBER OF SEQUENCES: 16
CORRESPONDENCE ADDRESS:

Patent No. 6551795

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AEROGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

LENGTH: 142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GENERAL INFORMATION:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Molecule type: protein
Residues: 114-194 «KAU>
.Residuental source: saliva
.Note: this peptide, which is closely related to that of peptide P-E, contains three 21
.Accession: A38355
.Molecule type: protein
.Residues: 10-67, K' «KA2>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     salivary proline-rich glycoprotein precursor PRB2 (validated) - human (fragment) N/Alternate names: basic proline-rich peptide IB-8c precursor; proline-rich protein (clo N/Contains: basic proline-rich peptide IB-4; basic proline-rich peptide P-F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cispecies: Homo sapiens (man) Fig. Cispecies: Homo sapiens (man) Fig. Cispecies: Homo sapiens (man) Fig. Cispecies: ListNov-1984 #sequence revision 12-Apr-1996 #text change 08-Dec-2000 Ciscoession: E25372; A60827; A01294; B38355; A38355; F38355 R38355; R383555; R38355; R383555; R38355; R383555; R38355; R38355; R383555; R383555; R383555; R38

C; Comment: This protein contains six 18- to 19-residue repeats.
C; Comment: This protein may protect teeth by binding to tannins.
C; Superfamily: proline-rich protein
